# 2 | Complément au laboratoire

Pour vous aider, n'hésitez pas à utiliser l'interpréteur RISC-V sur https://course.hevs.io/car/riscv-interpreter/ ainsi que Ripes.

Attention aux types des variables!

- Le type int est considéré de taille 32 bits signé.
- 0
- Le type **unsigned int** est considéré de taille 32 bits non-signé.
- Si il est suivi d'un nombre (ex: int16\_t), cela signifie que la variable est sur x bits (ici 16). Si précédé d'un u, il est non-signé.

uint8\_t est donc un byte non-signé, tandis que int8\_t est un byte signé.

# 2.1 Calculs de base

#### 2.1.1 Guide étudiants

```
a)
  # a = b + c;
  # s0 = a, s1 = b, s2 = c
  \# b = 1, c = 2
  addi s1, zero, 1
  addi s2, zero, 2
  add s0, s1, s2
                        \# a = b + c
  # s0 = 0 \times 000000003
  # s1 = 0 \times 000000001
  \# s2 = 0 \times 000000002
  \# b = -1, c = 2
  # s0 = 0 \times 00000001
  # s1 = 0xffffffff
  \# s2 = 0 \times 000000002
  \# b = -12, c = 2032
  # s0 = 0 \times 000007db
  \# s1 = 0xfffffff4
  \# s2 = 0x000007e7
```

```
b)

# a = b - c;
# d = (e + f) - (g + h);
# s0-s7 = a-h

...

# t0 = 0xffffffb1
# t1 = 0x000007db
# s0 = 0xffffffff
# s1 = 0x00000002
# s2 = 0x00000003
# s3 = 0xffffffd6
# s4 = 0xffffffff
# s5 = 0xffffffff
# s5 = 0xffffffft
# s7 = 0xfffffff4
```

isa/lab-basic-calc

#### 2.2 Accès mémoire

#### 2.2.1 Guide étudiants

HEI-Vs / ZaS, AmA / 2024

```
# Check for sign extension comprehension

# uint16_t a = mem[3];
# mem[4] = a;
# t0 is a
lhu t0, 3(zero) # if lh, the last bit may be 1 -> extended -> wrong number
sw t0, 4(zero)

# int16_t a = mem[3];
# mem[4] = a;
# t0 is a
??? t0, 3(zero) # if lh, the last bit may be 1 -> ???
??? t0, 4(zero)
```

isa/lab-memory

# 2.3 Algorithmes basiques

1. Transmettre la valeur de 8 bits de la mémoire à l'adresse 0x0000′1000 en série, bit par bit, dans le LSB de la mémoire à l'adresse 0x0000′1001. Les bits restants de l'adresse mémoire 0x0000′1001 doivent être < 0 >. Calculez le débit de bauds en Instructions Bit pour l'ensemble de la transmission.

2. Multiplier deux nombres de 4 bits ensemble en utilisant en plus une des commandes **bne** ou **bge**. L'algorithme fonctionne de la manière suivante : une multiplication est la même chose que l'addition x fois du même nombre. Par exemple : 2 \* 9 = 9 + 9 = 18.

#### 2.3.1 Guide étudiants

1. UART transmission idea:

```
# Serial UART Transmisstion
# setup
lui s2, 0x00001  # store UART base address
addi t0, zero, 0xA  # value to be send for testing
sb t0, 0(s2)  # save to memory

# start
lui s2, 0x00001  # store UART base address
addi s1, zero, 0x1  # store mask bit
lb s0, 0(s2)  # get value from memory

# send stopbit
sb s1, 1(s2)  # send stopbit to memory
addi zero, zero, 0  # nop
addi zero, zero, 0  # nop

# send startbit
...
```

```
# algorithm iteration #1 to #8
...

# send stopbit
addi zero, zero, 0  # nop
sb s1, 1(s2)  # send stopbit to memory
```

# 2. Two numbers basic multiplication with loops idea:

```
# Input values
# a0, a1 = input, a2 = output
addi a0, zero, 9
addi a1, zero, 2

# init output to zero
addi a2, zero, 0

# check if a1 is zero
if a1 == 0 => goto end
decrement a1

accumulate:
    accumulate into a2
    decrement a1
    continue if not 0
```

isa/lab-basic-algos

# 2.4 Branching

#### 2.4.1 Guide étudiants

# If / else

```
addi s0, zero, 1 \# int a = 1
addi s1, zero, 2 \# int b = 2
# if(a == b)
test1:
 bne s0, s1, test2 \# imm = 12
# a == b
equal:
 c = 0
 goto end
# else if b > a
test2: # a < b === b >= a
 if a < b => goto a_smaller
# a > b
a_bigger:
 addi s2, zero, 1
 jal end # imm = 8
# a < b
a_smaller:
 addi s2, zero, 2
```

```
end:
# ...
```

#### 2.4.2 Switch case

```
\# a = s0, mem[2] = s1
lw s1, 2(zero)
# if(b == 0)
bne s1, zero, not0 \# imm = 12
# b == 0
li s0, 17
jal end # imm = 48
# b != 0
not0:
 li t1, 3
 # if(b == 3)
 bne s1, t1, not3 # imm = 12
# b == 3
li s0, 33
jal end # imm = 32
# b != 3
not3:
 # if(b == 8)
 if(b == 8) goto is8_or_12 # imm = 20
 # if(b == 12)
 if(b == 12) goto is8_or_12 # imm = 12
# b != 8 | 12 (others)
li s0, 99
jal end # imm = 8
# b == 8 | 12
is8 or 12:
 li s0, 10
end:
# ...
```

# 2.4.3 While / Do While

```
// A : simple do-while
addi a5, zero, 10 # int a = 10;
while_entry:
   addi a5, a5, -1 # a--
   bne zero, a5, while_entry # imm = -4

// B : similar
addi a5, zero, 10 # int a = 10;
```

```
while_entry:
   addi a5, a5, -1 # a--
   if a >= 0 => goto while_entry

// C : uint32_t instead of int
...
```

# 2.4.4 For

```
# a is s0, i is s1, mem[0] = s2
lw s2, 0(zero) # loop target

# For the for to work, blte does not exist.
# Thus, since the loop decreases, a > b
# === a-1 >= b (for signed only, else infinite loop)
# so better a >= b + 1
addi s2, s2, 1 # target + 1
li s1, 4 # i = 4
mv s0, zero # a = 0

jal for_test # imm = 8

for_do:
   add s0, s0, s1
   addi s1, s1, -1 # MUST be at the end of for

for_test:
   bge s1, s2, for_do # imm = -8
```

isa/lab-branch

# 2.5 Functions

#### 2.5.1 Guide étudiants

# a) A function with context saving which can be b) A function with too many arguments optimized

```
# a is s0, b is s1
li s0, 1 # a = 1
mv a0, s0 # copy into a0 as funct. arg
jal ra, doubleIt # imm = undef.
mv s1, a0 # b = result
# DO NOT FORGET THE FOLLOWING
# a0 is a scratch register, and we called
# so we are not sure if a0 is still s0
mv a0, s0
jal ra, doubleItOpti # imm = undef.
mv s1, a0 # b = result
# ...
doubleIt:
 # save context
 addi sp, sp, -4
 sw s0, 0(sp)
  \# do a = a * 2
 mv s0, a0
  sll s0, s0, 1
 mv a0, s0
  # restore context
 lw s0, 0(sp)
  addi sp, sp, 4
  jalr zero, ra, 0 # or pseudo jr ra
# If 'a' should be a register
doubleItOpti:
 mv t0. a0
 sll t0, t0, 1
 mv a0, t0
 jalr zero, ra, 0 # or pseudo jr ra
# Most opti version
doubleItOpti2:
  # nothing to save since we can do it
with a0 directly
 sll a0, a0, 1
  jalr zero, ra, 0 # or pseudo jr ra
```

```
# a to j in s0-s10
# res in s11
li s0 1
li s1 2
li s10 10
# prepare arguments
mv a0, s0
mv a1, s1
mv a7, s7
# still two args to pass -> stack
addi sp, sp, -8
# It is important that the caller
# reserves the space. Also, note
# the order in stack.
sw s8, 4(sp)
sw s9, \theta(sp)
# call
jal ra, sum
# stack not needed anymore
addi sp, sp, 8
mv s1, a0 # b = result
# ...
 # do add with aX regs
 add a0, a0, a1
 add a0, a0, a2
 add a0, a0, a7
 # load i from over sp
 lw t0, 4(sp)
 add a0, a0, t0
  # load j from over sp
 lw t0, \theta(sp)
  add a0, a0, t0
  jr ra
```

isa/lab-fcts

# 2.5.2 Guide étudiants

#### 2.5.2.1 Modulo

```
# RV32IM
# a is s0, b is s1, c is s2
li s0, 9
li s1, 7
```

```
remu s2, s0, s1

# RV32I
# Call a div algorithm and take remainder
# Or call a sub loop

# Modulo of power of 2
li s0, 9
li s1, 8
addi t0, s2, -1 # pow 2 - 1
and s2, t0, s0
```

#### 2.5.2.2 °F -> °C

The main algorithm is:

```
begin:
   li s0, 550 # degrees farenheit
   li s1, 466034 # magic number
    mv s2, s0 # c = f
    # A: c = f - 32
    addi s2, s2, -32
    # B: c = c * 5
    # Variante 1 c*5 with shift
    # slli s3, s2, 2 # c * 4
    \# add s2, s3, s2 \# c + c (== * 5)
    # Variante 2 c*5 with function
    mv a0, s2
    li a1, 5
    # jal ra, mulFunct # func variant malFunct
    # jal ra, sfmulFunct # func variant sfmulFunct
    jal ra, fmulFunct # func variant fmulFunct
    mv s2, a0
    # C: c = c * 2^n / 9
    mv a0, s2
    mv a1, s1
    # jal ra, mulFunct # func variant malFunct
    # jal ra, sfmulFunct # func variant sfmulFunct
   jal ra, fmulFunct # func variant fmulFunct
    mv s2, a0
    # D: c >>= n
   srli s2, s2, 22
# End
nop
   j begin
```

The multiplication functions (from worst to best):

b)

```
a)
  # bad 0(n b)
  mulFunct: # mulFunct(int a, int b)
      # add itself each time
      mv t0, a0
      addi a1, a1, -1
      mul beg:
      bgeu zero, a1, mul_end # if 1 > b
      add a0, a0, t0
      addi a1, a1, -1
      j mul_beg
      mul_end:
      jr ra
  # better O(n_min[a,b])
  sfmulFunct: # sfmulFunct(int a, int b)
      swap a and b to loop less times
      loop to multiply
```

```
# best
fmulFunct: # fmulFunct(int a, int b)
    swap a and b to loop less times

mul_is_done:
    if b is 0 => goto fmul_end

    if b[0] is 0 => goto shift
add:
        add t0, a0, t0
shift:
        shift a0 left once
        shift a1 right once
        goto mul_is_done

fmul_end:
        mv a0, t0
        jr ra
```

The test with n = 23 should work for small numbers but overflow with bigger:

- 100F = 37C; 400F = 204C
- 1000F = 25C -> WRONG

$$\begin{aligned} \text{nbBits}_{\text{max}_{\text{fahrenheit}}} + \text{nbBits}_{\text{mult5}} + \text{nbBits}_{\text{magicNumber}} &= \\ 10(\text{max. } 1000\text{-}32) + 3 + (n - \text{nbBits}_{\text{div9}} + 1) &= \\ 10 + 3 + (16 - 4 + 1) &= \\ &= 26 \text{ bits} \end{aligned} \tag{1}$$

Because, following Équation 1, if n is  $23 \rightarrow$  equation gives 33 bits, but we are on 32.
